# SAVE MONEY AND THE ENVIRONMENT

The average American house produces 22,000 lbs of $CO_2$, twice as much as the average car according to the EPA.

Using a solar system on your home would be equivalent to:

Eliminating thousands of miles of driving, or

Planting hundreds of new trees.

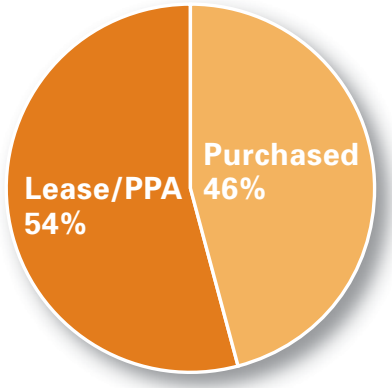
# JOIN THE SOLAR REVOLUTION

- The US is projected to become the world's largest solar market by 2014.
- Lease/PPA-financed residential solar installations have surpassed purchased solar systems, even in California, the largest solar market in the US[1].



# A SMART INVESTMENT

A 3.1-kilowatt solar system can add around $17,000 to the home's value.[2]

A home with solar panels will sell twice as fast as one without panels, even in depressed markets.[3]
